

Agent vs Synapse site recall

Both extraction runs scored against the 51-supplier ground truth, at two granularities.
The same ten columns appear in each table; only the definition of a “site” changes.

ground_truth.csv · 9,996 rows · 51 suppliers · scored 17 Sep 2026

AGENT RECALL

26.9%

city level · 22.2% at street level

SYNAPSE RECALL

4.6%

city level · 3.2% at street level

SUPPLIERS COVERED

46 / 27

agent / Synapse, of 51

RUN COST

\$28.01 / \$1.36

agent / Synapse, all suppliers

Table 1 · City level 1 site = country + city

The coarse view. A supplier’s 9,996 ground-truth records collapse to 4,121 distinct cities.
Forgiving of a system that names the right town but a vague street.

1 site = a distinct street address

share a city *and* a house number or half their street words — so AIRGAS LOCATION and TRINSE0 3, which name a city but no address, score zero here.

agent

Synapse

combined

bars are scaled 0–100%

Recall % = ground-truth sites the system found, over all ground-truth sites for that supplier. Totals are computed from counts, not by averaging the column — small suppliers scoring 100% on one site would otherwise outweigh Bosch’s 400.

New sites added by agent over Synapse is the raw count the agent returned and Synapse did not, whether or not the ground truth confirms it. Where Synapse returned nothing at all, it equals the agent’s full site count.

Synapse cost is the per-supplier allocation of a \$1.3649 run; \$0.40 of that run covers crawled pages that yielded no addresses and is attributable to no single supplier, so this column sums to \$0.96. Three suppliers carry a cost but no surviving rows (Acxiom, Jindal Poly Films, Automation Systems). **Agent cost** is model plus web-search spend from the last logged run per supplier.

A dash means the figure does not exist: no cost logged, or a supplier whose entire ground truth is flagged invalid, leaving no denominator.
