

Agent vs Synapse site recall

Both extraction runs scored against the 51-supplier ground truth, at two granularities. The same twelve columns appear in each table; only the definition of a “site” changes.

Agent recall 26.9% city / 22.2% street · Synapse recall 4.6% / 3.3% · suppliers covered 46 / 27 of 51 · run cost \$28.01 / \$1.36 · new sites 625 / 140 at street level

Table 1 · City level — 1 site = country + city

The coarse view. 9,996 ground-truth records collapse to 4,121 distinct cities. Forgiving of a system that names the right town but a vague street.

Table 2 • Street level — 1 site = a distinct street address

The granular view, over 7,549 distinct addresses. Two rows count as one site only when they share a city and a house number or half their street words.

GT sites — distinct ground-truth sites for that supplier.

Recall % — share of those the system found. Combined recall % — share found by either system.

New sites found by agent / by Synapse — sites the system returned that the ground truth does not contain. Unconfirmed, not wrong: the ground truth is an incomplete supplier master.

New sites by agent — sites the agent returned and Synapse did not, ground truth aside.

Costs — Synapse: each supplier's share of a \$1.36 run (\$0.40 of it unattributable, so the column sums to \$0.96). Agent: model and web-search spend per supplier.

Totals come from counts, not averaged percentages. A dash means the figure does not exist.
